

VLP has specialised for 30 years in “flexible partitioning” for a wide variety of sectors, with products including: (industrial) partition walls and curtains, swing doors, high-speed rolling doors, retractable tunnels and industrial tents as well as dock shelters and dock levelers.

VLP SLIDING WALLS

VLP Sliding Walls are large, transparent panels of transparent plastic film for the rapid enclosure of workspaces or the separation of crops. The double rails allow panels to run parallel to each other. Various options are available, such completely or partially non-transparent curtains, gauze-filled, flame-retardant, soundproof or thermally insulating. This makes them suitable for resisting cold, draughts, dust, noise, moisture, birds and insects in horticulture, industry, garages and storage companies, the foodstuffs sector and the utilities sector.

VLP SLIDING WALLS

APPLICATIONS

VLP Sliding Walls are ideal for enclosing large areas relatively quickly and easily. They are extremely well-suited to screening off crop-growing areas in greenhouses, allowing the enclosed area to be heated, ventilated or disinfected separately. The use of crystal-clear foil guarantees maximum light transmission. However, shading or extra insulating materials are available for this flexible partitioning system.

DESIGNS

The sliding panels of the VLP Sliding Wall system comprise curtains of flexible, crystal-clear 0.5 mm thick PVC foil. Tension rods in the side seams prevent the walls from billowing or blowing upwards. The curtains are mounted in an aluminium roller profile and fitted at the lower edge with a horizontal weighting tube. The roller profile is fitted with stainless-steel ball-bearing wheels with plastic runners for quiet operation. The bottom edge of the upper rail is beveled to prevent the roller profile from rubbing. Flaps on the underside of the sliding wall adjust to height variations in the floor.

OPTIONS

There are various options for VLP Sliding Walls. These include parapet, pulling loops, right-angled sealing flaps for inter-panel sealing, sacrificial sliding borders, rollable hatch in the cloth, extra wind strips, rail lock, bearing construction and upper seal. It is also possible to fit breaks in the rail and bearing construction at locations where a monorail channel for hanging transport runs across the rail.
